

Our 4G Network

UK Broadband has now switched on its first 4G LTE system in London.

This is the first commercial deployment of 4G LTE in the UK and will be available for customers from May 2012 on a wholesale basis. We will be building additional networks in other parts of London and the UK, including in rural areas to provide NGA broadband to the home, in line with demand.

Working with our partners, our network will deliver on the promise of wireless cities, providing access to rich media on the move and true mobile working with content and applications available on demand when and where you need them.

We will offer a nimble and creative approach, tailoring our offering to provide flexible business models.

As well as our plans to build further 4G LTE networks in both cities and rural areas, we already offer a broad portfolio of wireless solutions for urban and rural data connectivity nationwide.
