

## Mobile Working

Mobilising your staff and reducing the need for them to return to the office by providing fast wireless access to central systems where and when they need it; is one way technology can help support the efficiencies organisations seek.

But, combining innovative ways of working and new technology brings challenges.

Existing mobile broadband systems provide wide area coverage but lack the guaranteed service levels that ensure mobile workers can have the access they need, whilst local Wi-Fi networks can suffer from restricted footprints and uncontrollable radio interference.

UK Broadband is able to offer a customised mobile wireless service using our licensed spectrum which means we can provide coverage and throughput service level guarantees that mean you can assure your customers of minimum data transfer rates and defined areas of interference free connectivity, essential for services like Virtual Private Networks and Voice over IP.
