

Rural Broadband

Providing broadband to rural communities cost effectively has proved a challenge over many years and still remains of primary concern to the Government and local authorities in rural areas.

Wireless communications offer an ideal solution where it is not cost effective to deliver fibre and where other fixed line services are poor due to the distance from the exchange.

LTE, over a large holding of licensed radio spectrum, which UK Broadband has, is the only wireless technology that can deliver the benefits of superfast Next Generation Access broadband to homes and businesses in rural areas and complements planned fibre infrastructure.
